Dear New Mexico Botanists,

The surest way to be caught in a mistake is to make a statement about a plant and send it around to 100 or so botanists! E.O. Wooton's collection of *Senecio parryi* does indeed still exist, and is to be found at the U.S. National Herbarium. For whatever reason, this specimen does not appear in the SEINet database, so we missed it. A photo is attached. It was collected 8 Aug 1900, from Mogollon.

Many thanks to Harpo Faust of the UNM Herbarium for providing this information to us!

Kelly Allred

P.S. The moral of this story? If you never want to be caught in an error, never write anything!

P.P.S. We can always trust E.O. Wooton!
